

What is a glassless mirror?

Our glassless mirrors are made of a high optical grade, very tough film that does not shatter or break into dangerous shards when impacted. The reflected image is super clear high definition and amazingly bright compared to glass or plastic mirrors.

Glassless mirrors are made from a highly reflective metallized polyester film. This film is vacuum-stretched around a frame to form a mirror.

Glassless mirrors reflectivity

94% Reflectivity for projection
85%-86% Reflectivity for general use

Each mirror panel is a structural entity and must be made at the factory to specific dimensions. Normal fabricating tolerances are $\pm 1/8''$ on length and width. A wide range of sizes are available and custom sizes can be made to order.

Lighter and Brighter than Plate Glass!
