How to Use Safe Ear Curettes

Part of the beauty of the Bionix Safe Ear Curette is its simplicity. There are two simple ways to use the curettes for the removal of cerumen - direct curettage, and curettage through an Otoscope.

Direct Curettage:

1. Check the ear with an Otoscope to see where the cerumen is.
2. Gently grasp the ear to straighten the ear canal.
3. Select the proper curette for the job.
4. Use the curette to remove the cerumen.
5. Re-check the ear to see if any cerumen is left.
6. Repeat the process until all the cerumen is gone.
7. Discard the curette (intended for single patient use, only).

Through an Otoscope:

1. Check the ear with an Otoscope to see where the cerumen is.
2. Keep the Otoscope in, and slide the scope magnifier to one side.
3. Select one of the Youth/Small curettes.
4. Use the curette to remove the cerumen.
5. Re-check the ear to see if any cerumen is left.
6. Repeat the process until all the cerumen is gone.
7. Remove the Otoscope and discard the curette.
