

Roll-Control Bolsters

Reorder # 556010

Purpose

Roll-Control Bolsters are designed to be used as positioning devices to support a resident on his/her side and to reduce the likelihood that a resident will roll off the bed when one or both rails are in the lowered position. These bolsters may also be used to prevent a resident's arm, legs, or head from being entrapped between the mattress and bed rail.

Caution

The Roll-Control Bolsters are not substitutes for bed side rails. If you plan to use the Roll-Control Bolsters and leave one or both side rails in the lowered position, it is the responsibility of the facility and its qualified healthcare professionals to evaluate the resident to determine if that resident should be permitted to leave the bed at his/her discretion. Roll-Control Bolsters are not as effective as side rails for preventing a resident from rolling off or leaving the bed.

Application

When using Roll-Control Bolsters as barriers to reduce the likelihood that a resident will roll of the bed when one or both side rails are in the lowered position, or when used with side rails in the raised position to prevent the resident's head or limbs from being caught between the mattress and side rails.

1. Place the Roll-Control Bolsters at the left and right sides of the bed. Leave enough space to allow a pillow to fit between the ends of the bolsters and the headboard. (Illustration A)

2. Bring the end of the strap under and around the upper part of the bed frame. (Illustration B) Feed the strap through the slider. (Illustration C) Tighten strap, making certain that the bolster is positioned near or at the edge of the mattress. **Do not secure the strap to the side rail.**

3. Thread the Velcro® strap attached to one bolster through the d-rings at the back of the opposite bolster. Bring the straps over the bolster and thread them through the d-rings at the back of the bolster. Take up any slack in the Velcro® strap and secure them by pressing the "hook" material against the "loop" material. (Illustration D)

4. For sleeping comfort, cover the straps that cross the bed with a folded sheet, synthetic sheepskin pad, or Skil-Care's TLC Pad. The TLC Pad, described on the reverse side, is an absorbent pad that has handles on its four corners that make turning and the positioning residents easy and reduce the likelihood of caregiver back injury. (Illustration E)

5. To facilitate taking the resident out of bed, release the Velcro® closures and remove one bolster.

When using Roll-Control Bolsters as positioning aids.

1. Secure bolsters so that they are positioned near the center of the bed. (Illustration F)

2. Place resident between the bolsters so that one supports him/her from behind and the other prevents the resident from rolling forward. (Illustration G)

3. To facilitate turning resident, try Skil-Care's TLC Pad. (Illustration H) The turning procedure for the TLC Pad is described on the reverse side.

Cleaning

The Roll-Control Bolsters may be cleaned with any standard spray-type cleaner and a damp cloth or sponge. A mild disinfectant may be used.

Turning and positioning requires TLC

When turning and positioning residents, Skil-Care's new TLC Pad is the perfect partner for the Roll-Control Bolsters. It's comfortable for sensitive bed patients and it reduces the likelihood of caregiver back injury.

Designed for long-term use and fitted with strong web handles, the TLC pad is perfect for...

Turning

Frail, sensitive patients often experience pain while being turned -- even by the gentlest hands. The TLC Pad eliminates hands-on pressure so turning becomes pain-free. Convenient and efficient, the TLC Pad makes it possible for one caregiver to turn and position a patient.

Incontinence

The three-layer construction of the TLC Pad includes a poly-cotton top that wicks urine away from the patient, and absorbent foam middle, and a liquid-proof vinyl barrier on the bottom to protect the bed.

Reducing Back Injury

Back-related injuries often occur when caregivers turn and position patients in bed. The TLC Pad is designed to take the strain of the back. It also permits two caregivers to turn heavier patients.

Comfort and Pressure Reduction

The comfortable combination of soft brushed fabric and foam make the TLC Pad an effective way to reduce pressure for frail, bed-bound patients.

Durable and launderable

Made for long-term use, Skil-Care's TLC Pad has strong web handles that are stitched and reinforced with nylon thread. The TLC pad stands up to repeated institutional launderings.

Order Skil-Care TLC Pads when you order Roll-Control Bolsters... they're made for each other.
